BRINGING TECHNOLOGY IN: Lower-income parents respond to changes in classroom learning

The majority of parents report that their children are using technology frequently at school.

But, about one in six (16%) parents don’t know how much time their child spends using computers or tablets in the classroom.

And most are satisfied with the amount of class time their children spend using technology.

What can educators do to help?

Parents see technology as supporting their children’s classroom success...

...but they also worry that classroom technology use hurts the quality of student-teacher relationships.

Parents also see potential for both opportunity and risk in their children’s technology use, in and out of school.
